1 Introduction

Individuals with ADHD diagnoses or ADHD-like traits often struggle with consistent routine development. According to the American Psychiatric Association, ADHD is classified into three subtypes: Inattentive, Hyperactive-Impulsive, and Combined. Building routines is one of the most effective solutions yet can be challenging for people with ADHD. Some challenges include lack of focus, hyperactivity, and inattention.

Gold Star is a web-based habit-building and time management platform tailored to those affected by ADHD, designed to help users organize their schedules, break down tasks, and build sustainable routines — making it easier to start, stay on track, and follow through every day.

2 Gold Star Product Description

Gold Star is a web-based productivity and habit-building platform designed primarily for individuals with ADHD struggling with routine creation and maintenance. Many people with ADHD struggle with organization, time management, and keeping up with daily responsibilities. Gold Star gives users a low-stakes environment where tasks, schedules, and habits are monitored without feeling overwhelmed. This web application is intended for easier routine development and maintenance, while offering support for users struggling to preserve long-term goal consistency.

2.1 Key Product Features and Capabilities

Gold Star uniquely focuses on helping users organize tasks and schedules through an Adaptive Scheduling system which adjusts to missed tasks and changing priorities. It evolves with the user, reducing the frustration of falling behind, making it easier to stay on track. It utilizes techniques such as Habit Stacking, Activity Alternation, and the Pomodoro Technique which are recommended for people who struggle with ADHD-like symptoms.

Users can choose their productivity level and alter their schedule at any time throughout the day, giving them enough flexibility to feel successful. Users can group tasks by importance level, allowing Gold Star to become personalized to their unique scheduling needs.

Gold Star rewards the user for completing tasks and milestones, giving them a sense of accomplishment. It does not punish them for missing goals, instead featuring a “Roll Over” system, allowing the user to move their missed tasks to another day. Combining flexibility and structure, the platform helps users overcome common ADHD challenges such as task initiation, consistency, commitment, and completion, ultimately improving productivity and reducing daily life stress.

2.2 Major Components (Hardware/Software)

The system requires no specialized hardware. Users can access the application through any off-the-shelf device with a modern web browser. The server side runs on a single hosting environment supporting the Node.js web server and PostgreSQL database, with deployments being automatically pushed through GitHub. As shown in Figure 1, the system follows a three-tier structure: a Presentation Layer (the web-based UI), an Application Layer (the Node.js web server / API with authentication, and a notification handler), and a Data Layer (PostgreSQL database storing the encrypted user data, tasks, and routine data).

The software to be developed includes the UI/UX built with HTML, CSS, and JavaScript. It will feature a calendar view, routine dashboard, productivity level system, and statistics dashboard. It will also feature a Node.js web server handling routing, logic, authentication components, and a WebSocket-based notification handler. A PostgreSQL database is included to store user account information, saved tasks, routine data, and sensitive user information kept in

an encrypted form. Development is supported by off-the-shelf tools: Visual Studio Code, Git, GitHub, GitHub Actions for CI/CD, Jest for testing, and Javadoc for documentation.

4 Glossary

Application Programming Interface (API) - A set of standard rules, protocols, and definitions that allow different software applications to interact.

Attention-Deficit/Hyperactivity Disorder (ADHD) - A common neurodevelopmental disorder that alters the brain's ability to plan, focus, remember instructions, and manage emotions.

Cascading Style Sheets (CSS) - A style sheet language used to determine the visual presentation, layout, and aesthetics of a website.

Git - A digital version control system intended to preserve a history of saved modifications, additions, and deletions to software source code.

GitHub - A cloud-based platform where developers can collaborate on software code.

Gold Star - A web-based habit-building and time management platform designed specifically for individuals with ADHD.

Hyperactivity - A state of being unusually or abnormally active.

HyperText markup Language (HTML) - The standard markup language used to create and structure webpages.

Javascript (JS) - A lightweight programming language used to build dynamic interactivity on web pages.

Jest - An open-source Javascript testing framework.

JSDoc - An API documentation generator and syntax standard for JavaScript.

PostgreSQL - An open-source RDBMS that stores, manages, and retrieves data.

Reinforce - To make something stronger, more effective, or more compelling by adding support.

Relation Database Management System (RBMS) - software used to store, manage, query, and retrieve data structured in table form.

Routine - A sequence of actions regularly followed, or a fixed program.

Visual Studio Code (VSCode) - A development environment used for software engineering and web development.
